

Daily System Development Report

Date: June 3, 2026

Project: JB Groups ERP & Tailoring Management System

Prepared For: Executive Review

1. Executive Summary

Today's development focus was on expanding operational controls, enhancing staff record bookkeeping, and enforcing business logic consistency in order fulfillment. Key modules have been upgraded to support deep operational profiles, real-time validations, and sequential status tracking, ensuring complete visibility and financial accountability. The system build compiles cleanly with zero warnings or errors.

2. Key Accomplishments Today

A. Extended Staff Enrollment & Roster System

To support HR compliance and standard financial records, the **"Enroll Staff"** module was heavily upgraded:

- * **Comprehensive Profiles:** Form controls now capture 20+ fields across 4 distinct categories:
 1. *Personal Details:* Full Name, DOB, calculated Age, Gender, Marital Status, Religion, Photo Link (with live image preview), Contact, Email, and Permanent Address.
 2. *Employment Details:* Designation, Basic Monthly Salary, and Date of Hire.
 3. *Emergency Contact:* Full details including relationship and address.
 4. *Bank Details:* Account holder, bank name, account number, branch, and link to the signed passbook photo.
- * **Automated Calculations:** Implemented dynamic client-side age calculation from the entered DOB relative to the reference date 2026-06-03.
- * **Roster Card Modals:** Created a read-only **Staff Profile Card** allowing administrators and managers to view comprehensive records in a structured grid card format.

B. Order Stage Expansion ("Delivered to the Customer")

- **Sequential Transitions:** The order lifecycle was updated from 3 stages to 4: pending -> in-progress -> completed -> delivered.
- **Workflow Constraints:** Implemented strict validation checks preventing status skips (e.g., an order cannot move from pending directly to completed or delivered without first transitioning through sequential intermediate steps).
- **Workload Safety:** Upgraded staff workload calculations to count both completed and delivered statuses. This prevents tailor productivity ratings from dropping when orders are

delivered to the customer.

C. Financial Validation & POP-UP Overrides

- **Zero-Outstanding Balance Enforcement:** Implemented strict checks when moving an order to delivered. If there is any outstanding balance, a popup notifies the user and asks if they want to pay the balance now. If the balance is paid, delivery is completed; otherwise, the transition is blocked.
- **Stock Deductions:** Integrated automatic inventory consumption (fabrics, threads, buttons) upon order completion or delivery.

D. Refined Analytics & Dashboards

- **Strict Daily Scope:** Re-calibrated the KPI metrics on the dashboard to reflect **Today's Completed Orders** strictly matching 2026-06-03, rather than cumulative historical lists.
- **Dynamic Range Counters:** Added range count badges to filter outputs to show how many orders match selected date ranges.

3. Core System Architecture & Features

The JB Groups application comprises several integrated modules:

Module	Core Purpose	Key Features
Order Management	Booking and lifecycle tracking	Sequential progress, stock deduction, payment validations.
Customer Directory	Customer profiles and stitching history	Preferences tracking, historical order timeline.
Staff & HR	Roster, attendance & payroll	Overtime calculation, leave deductions, profile views.

Inventory Control	Raw materials & retail stock	Category tracking, cost basis, reorder thresholds.
Complaints System	Customer quality assurance	Action assignment, evidence logging, resolution tracking.
Approvals Queue	Risk mitigations for critical changes	Price overrides and deletions require manager authorization.
Security Auditing	Traceability	Cryptographic timestamped audit log of all system changes.

4. Database Integration Status

- **Hybrid Storage Engine:** The system runs a local-first storage layout synced in real-time to a **Firebase Firestore** server. This guarantees offline capability alongside cloud availability.
- **SQL Schema Migrations:** The **Supabase (PostgreSQL)** database schema comment in [supabaseClient.js](#) was successfully updated to match the new `staff` structural requirements, enabling direct cloud migration in the next phase.

5. Verification & Build Quality

- **Production Build Validation:** Run `npm run build` locally. The Vite production bundler finished building in **16.79 seconds** with **zero compilation errors**, verifying strict syntax checks and package dependency imports.
